Enkaku

When focusing on Internet research, we should make a clear distinction between research on the Internet in a medium, and Internet-based research. The former can be carried out in ways that do not rely on the Internet itself. The latter depends on the subjective nature of the research which determines the most suitable method to obtain the response to the questionnaire.

The research on the Internet in this case of other media can take into consideration various aspects of the medium as well as various levels of its development.

The medium itself
Although one may rely on statistical methods of research, it is not always easy to ensure the reliability of the results. The effectiveness of various treatments is often assessed through randomized controlled trials. However, the results of such trials may be influenced by various factors, including the quality of the interventions, the adherence of participants to the treatment protocols, and the generalizability of the findings to other populations. It is important to consider these factors when interpreting the results of any research study.
Fig. 2. The level of care of out-patients after five weeks (p < 0.01)

**Note:** The text on the page appears to be a continuation of a discussion on medical care, possibly related to Fig. 2, which is titled "The level of care of out-patients after five weeks." The figure suggests a statistical comparison with a p-value of less than 0.01, indicating a significant difference. However, the specific details of the comparison or the context are not fully visible in the image provided.
Fig 5. The survey distribution in the network is random.

The second option can be modified in various ways. For instance, the survey can be conducted via automated polling tools, displayed on the network, or directly sent to participants through email. However, the second option is more likely to be used in situations where the survey is not published in the network, or where the participants are not directly connected to the network. In such cases, the questionnaire can be distributed through various channels, including email, social media, or other communication tools.

Finally, the survey can also be completed through online channels, such as websites or mobile applications. This option is particularly useful for surveys that require the collection of sensitive information, as it ensures the confidentiality and anonymity of the participants. In addition, the online option allows for the collection of data from a larger and more diverse population, as it is not limited to participants who are physically present in the network.

In conclusion, the survey distribution in the network is random, and the second option is more likely to be used in situations where the survey is not published in the network, or where the participants are not directly connected to the network. The online option is particularly useful for surveys that require the collection of sensitive information, as it ensures the confidentiality and anonymity of the participants. In addition, the online option allows for the collection of data from a larger and more diverse population, as it is not limited to participants who are physically present in the network.
